

## WHAT IS APPENDICITIS?

Appendicitis is an inflammation of the appendix, a 3 1/2-inch-long tube of tissue that extends from the large intestine. Sometimes a pus-filled abscess (infection that is walled off from the rest of the body) forms outside the inflamed appendix

## SYMPTOMS OF APPENDICITIS

- Dull pain near the navel or the upper abdomen that becomes sharp as it moves to the lower right abdomen. ...
- Loss of appetite.
- Nausea and/or vomiting soon after abdominal pain begins.
- Abdominal swelling.
- Fever of 99-102 degrees Fahrenheit.
- Inability to pass gas.

## CAUSES OF APPENDICITIS

A blockage in the lining of the appendix that results in infection is the likely cause of appendicitis. The bacteria multiply rapidly, causing the appendix to become inflamed, swollen and filled with pus. If not treated promptly, the appendix can rupture.
